# **1.INTRODUCTION**

## **Project Overview**

*Forests, which are diverse centers of flora and wildlife and create 1/3 of the world's oxygen, are at risk of forest fires, both natural and man-made. The precaution of averting such a massive devastating flare can save many animals and the environment. Protecting forests before they are harmed is a method of repaying Mother Nature's everlasting gift.*

*Wildfires are one of the biggest catastrophes faced by our society today causing irrevocable damages. These forest fires can be man-made or caused by mother nature by different weather conditions, torrential winds. These fires cause damages not only to the environment they also destroy vast homes and property.*

## **Purpose**

*Forest fires have become a major threat around the world, causing many negative impacts on human habitats and forest ecosystems. Climatic changes and the greenhouse effect are some of the consequences of such destruction. A higher percentage of forest fires occur due to human activities. The goal of the project is to develop a forest fire detection system that can identify forest fires in their early phases.*

## **2. LITERATURE SURVEY**

### **Existing Problem**

*Every year, there are an estimated 340,000 premature deaths from respiratory and cardiovascular issues attributed to wildfire smoke.*

*The increasing frequency and severity of wildfires pose a growing threat to biodiversity globally. Individuals, companies and public authorities bear great economic costs due to fires. In order to reduce all these, we need to detect the forest fire at an early stage and prevent it.*

### **Problem Statement Definition**

- *In the past, fires were detected by watching towers or using satellite images.*
- *Satellites collect images of fires and send them to a monitoring authority for review. If the images*

*appear to show a fire, the authority will determine whether the fire is burning or not.*

- *But this approach was slow because the fire may have spread in the large areas and caused a lot of damage before the rescue team arrived.*
- *Since it's impossible to place a man in every part of a forest, it's important to have monitoring devices in certain areas so we can keep an eye on the forest.*
- *Both watching towers and satellite images failed to detect the presence of a fire early on, which resulted in more damage being done by the fire.*
- *Predictive analytics based on these insights are becoming increasingly effective in detecting, mitigating and preventing fires.*

### 3. IDEATION AND PROPOSED SOLUTION

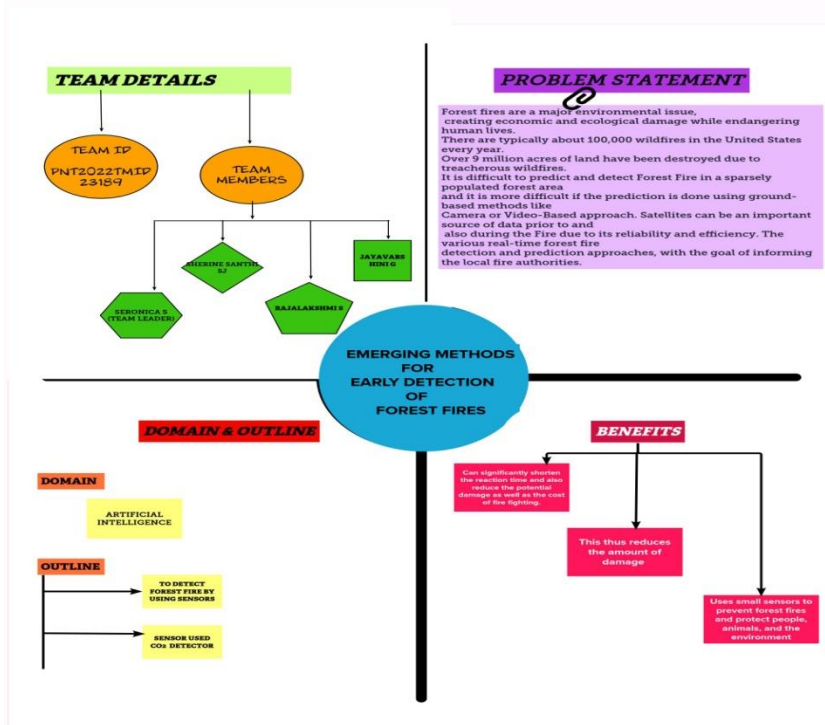

## Empathy Map Canvas

Edit this template  
Right-click to unlock

## Empathy Map

Dive into the mind of the user for focused product development

Build empathy and keep your focus on the user by putting yourself in their shoes.

# Ideation and Brainstorming

Template

## Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

 10 minutes to prepare  
 1 hour to collaborate  
 2-8 people recommended

[Show template feedback](#)

### Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

 10 minutes

 **Warm gathering**  
Define who should participate in the session and send an invite. Share relevant information as pre-work ahead.

 **Set the goal**  
Think about the problem you'll be focusing on solving in the brainstorming session.

 **Learn how to use the facilitation tools**  
Use the Facilitation Superpowers to run a happy and productive session.

[Open article](#)

### Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

 5 minutes

 How might we [your problem statement]?

#### Key rules of brainstorming

To run an smooth and productive session

|  |  |
|--|--|
|  Stay in team.    |  Encourage wild ideas.  |
|  Defers judgment. |  Listen to others.      |
|  Go for volume.   |  If possible, let ideas |

#### Need some inspiration?

See a featured version of this template to kickstart your work.

[Open example](#)

2

### Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Tip

You can select a sticky note and hit the arrow (point to it) to select it (or the other direction!)

#### PRANATHI.R

IoT/Temperature sensors are deployed throughout the coverage area. IoT levels can be monitored every 15 minutes (or less) along with temperature, battery status etc.

Heat detectors are the most basic detection devices. They are available in several types. These types are spot and line.

The gateway provides LoRaWAN coverage for up to 15KM or more outdoors, providing low power wireless access to the network of sensors.

The network can detect fires quickly while consuming energy efficiently.

#### PREETHI.S

In recent history and even the present day, several forest fire detection methods have been implemented, such as watchtowers, satellite image processing methods are used.

Forest fire detection uses the technique of optical sensors and digital camera based methods are used to monitor the fires.

Spot detectors are single units installed in single locations throughout the protected area by detecting the forest fires.

By using the MWIR, infrared cameras can be used to detect heat and with particular algorithms can detect hotspots with in a scene as well as flames for both detection and protection of fire and risks of fire.

#### MONISHA.P

In preprocessing unwanted distortions are removed and image is rotated and transformations of rotated image is performed.

Upon receiving sensor data, the gateway transmits the data back via satellite in an optimized manner to a cloud platform or dashboard.

High frequencies of an image are eliminated using SWT and the reconstruction of image are done by inverse SWT.

This method involves three steps: processing, SWT, histogram analysis.

#### SANGEETHA PRIYAR

Sensor technology has been widely used in fire detection mostly depending on sensing physical parameters such as changes in pressure, humidity and temperature, as well as chemical parameters such as carbon dioxide, carbon monoxide and nitrogen dioxide.

The first factor is the rapid development of digital camera technology and CCD or CMOS digital camera which has resulted in a rapid increase in image quality and decreased cost of the cameras.

The second factor is that digital cameras can cover large areas with excellent results.

Third, the response time of image processing models is better than that of existing sensor models. Finally, the overall cost of image processing systems is lower than existing systems.

3

### Group Ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

20 minutes

Detect fire using Temperature Levels

Detection of forest fire is done through the deployment of YOLOv4 to UAV-based aerial images.

Detecting smoke with video cameras and algorithms.

Autonomous Drone Routing.

Infrared cameras for early warning fire detection

Terrestrial Image-Based 3D Modeling.

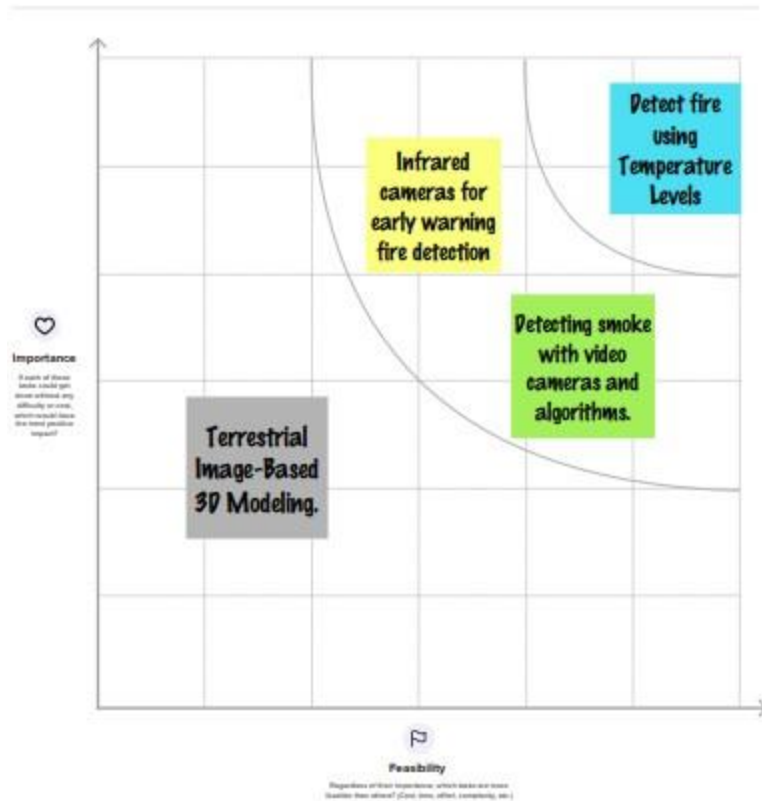

#### 4

### Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

20 minutes

#### 5

### After you collaborate

You can export the mural as an image or pdf to share with members of your company who might find it helpful.

#### Quick add-ons

- Share the mural**  
Share a view link to the mural with stakeholders to keep them in the loop about the outcomes of the session.
- Export the mural**  
Export a copy of the mural as a PNG or PDF to attach to emails, include in slides, or share to your device.

#### Keep moving forward

- Strategy blueprint**  
Define the components of a new idea or strategy.  
[Open the template](#)
- Customer experience journey map**  
Understand customer needs, motivations, and obstacles for an experience.  
[Open the template](#)
- Strengths, weaknesses, opportunities & threats**  
Identify strengths, weaknesses, opportunities, and threats (SWOT) to develop a plan.  
[Open the template](#)

[Share template feedback](#)

## **Proposed Solution**

| <i>S.No.</i> | <i>Parameter</i>                                | <i>Description</i>  |
|--------------|---|---|
| <i>1.</i>    | <i>Problem Statement (Problem to be solved)</i> | <i>Over the last few decades, forest fires are increased due to deforestation and global warming. Many trees and animals in the forest are affected by forest fires. Technology can be efficiently utilized to solve this problem. Forest fire detection is inevitable for forest fire management.</i>  |
| <i>2.</i>    | <i>Idea / Solution description</i>              | <i>Modern fire protection systems are comprised of three main components — fire detection, alarms and notifications, and suppression, all of which must function together to provide the necessary fire protection for a given building. Designing a fire alarm and notification system requires an integrated approach that includes a comprehensive analysis of the entire fire protection system. This analysis is necessary to gain a thorough understanding of how all the main components of the overall fire protection system will work together. This analysis needs to be conducted before the system is installed.</i> |
| <i>3.</i>    | <i>Novelty / Uniqueness</i>                     | <i>The novelty of system is real-time monitoring, early prediction, validation through UAV and fire confirmation using image processing. The proposed system presents higher true fire detection rate of about 95-98 percent.</i>   |

|    |  |  |
|----|--|--|
| 4. | <i>Social Impact / Customer Satisfaction</i> | <p><i>Timely information about the appearance of fire reduce the number of areas affected by this fire and thereby minimizes the costs of fire extinguishing and the damage caused in the woods. Monitoring of the potential risk areas and an early detection of fire can significantly shorten the reaction time and also reduce the potential damage caused by the forest fire.</i></p>   |
| 5. | <i>Business Model (Revenue Model)</i>        | <p><i>Aspirating smoke detectors continuously sample air to provide early warnings of fire hazards, helping detect threats before they escalate. Some devices provide multi-level warnings and are equipped with wide- ranging sensitivity to identify even the most negligible amounts of smoke, helping to prevent small fires from taking hold and causing widespread damage.</i></p> <p><i>Unlike traditional detection technology – which is largely passive, waiting for smoke to reach sensors – aspirating devices are designed to sample and test air near the most likely sources of fires throughout a building. Aspirating smoke devices can be positioned in hard-to-monitor places, such as ceilings, air grilles and openings, or within critical spaces, including operating and patient rooms. Early detection technologies can also draw air from targeted locations back to a central system that continuously monitors for trace amounts of smoke.</i></p> |

|    |                                    |  |
|----|------------------------------------|--|
| 6. | <i>Scalability of the Solution</i> | <p><i>Changes in the use or occupancy of a building can result in compliance issues and a fire alarm system that no longer provides sufficient protection. If future changes are anticipated, fire safety engineers can design a fire alarm system with this in mind, providing a flexible infrastructure that includes the proper wire size and additional circuits distributed in a way that accommodates future growth and change.</i></p> <p><i>Perhaps one of the most compelling reasons to design a fire alarm system that goes above and beyond the minimum requirements from the start is the fact that fire codes and other applicable regulations can and do change. And, changes that are made retroactively can trigger potentially very expensive alterations in a fire alarm system. This is also why it is so important to work with highly qualified fire safety engineers who can anticipate coming changes and proactively design your system to meet new requirements.</i></p> |
|----|------------------------------------|--|

# Problem Solution Fit

## Problem-Solution fit canvas 2.0

| EMERGING METHODS FOR EARLY DETECTION OF FOREST FIRES |   |   |   |                           |

## **4.REQUIREMENT ANALYSIS**

### **Functional Requirements**

Following are the functional requirements of the proposed solution.

| <b><i>FR No.</i></b> | <b><i>Functional Requirement(Epic)</i></b> | <b><i>Sub Requirement (Story / Sub-Task)</i></b>         |
|----------------------|--|--|
| <b><i>FR-1</i></b>   | <b><i>Video surveillance start</i></b>     | <b><i>Start surveillance through remote control</i></b>  |
| <b><i>FR-2</i></b>   | <b><i>Forest monitoring</i></b>            | <b><i>Continuous monitoring through camera</i></b>       |
| <b><i>FR-3</i></b>   | <b><i>Detect fire</i></b>                  | <b><i>Fire is detected through CNN model</i></b>         |
| <b><i>FR-4</i></b>   | <b><i>Alert</i></b>                        | <b><i>Alert the forest officials through message</i></b> |

### **Non-functional Requirements:**

Following are the non-functional requirements of the proposed solution.

| <b><i>FR No.</i></b> | <b><i>Functional Requirement(Epic)</i></b> | <b><i>Sub Requirement (Story / Sub-Task)</i></b>    |
|----------------------|--|---|
| <b><i>FR-1</i></b>   | <b><i>Reliability</i></b>                  | <b><i>Model is safe to install</i></b>              |
| <b><i>FR-2</i></b>   | <b><i>Security</i></b>                     | <b><i>More secure environment</i></b>               |
| <b><i>FR-3</i></b>   | <b><i>Availability</i></b>                 | <b><i>Build model is available all the time</i></b> |

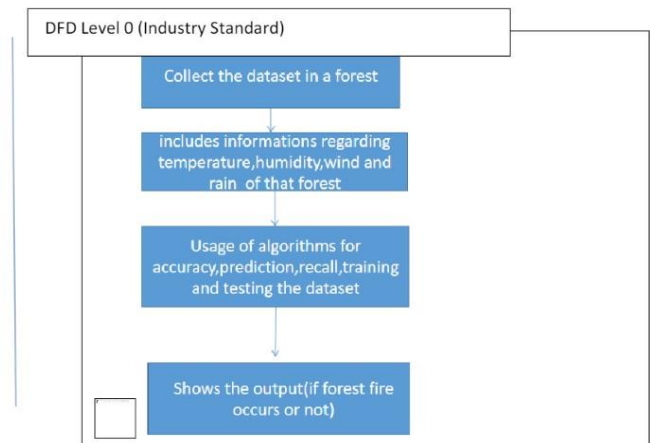

|             |                    |   |
|-------------|--------------------|---|
| <b>FR-4</b> | <b>Performance</b> | <i>Model will achieve high accuracy</i> |
|-------------|--------------------|---|

## **5. PROJECT DESIGN**

### **5.1 Data Flow Diagrams**

1. COLLECT DATA
2. EVALUATE DATA SET
3. IMPLEMENT ALGORITHMS
4. EVALUATE THE ACCURACY OF EACH ALGORITHMS
5. DISPLAY RESULTS

### ***Solution and Technical***

### ***Architecture Solution Architecture***

***1. This Solution Architecture involves four stages.***

- a. Input Image***
- b. Region Proposal***
- c. Feature extraction & classification***
- d. Output detection result***

***Step 1: We get the input image and discuss feature maps, learning the parameters of such maps, how patterns are detected, the layers of detection, and how the findings are***

*mapped out.*

*Step 2: The second part of this step will involve the Rectified Linear Unit or ReLU. We will cover ReLU layers and explore how linearity functions in the context of Convolutional Neural Networks.*

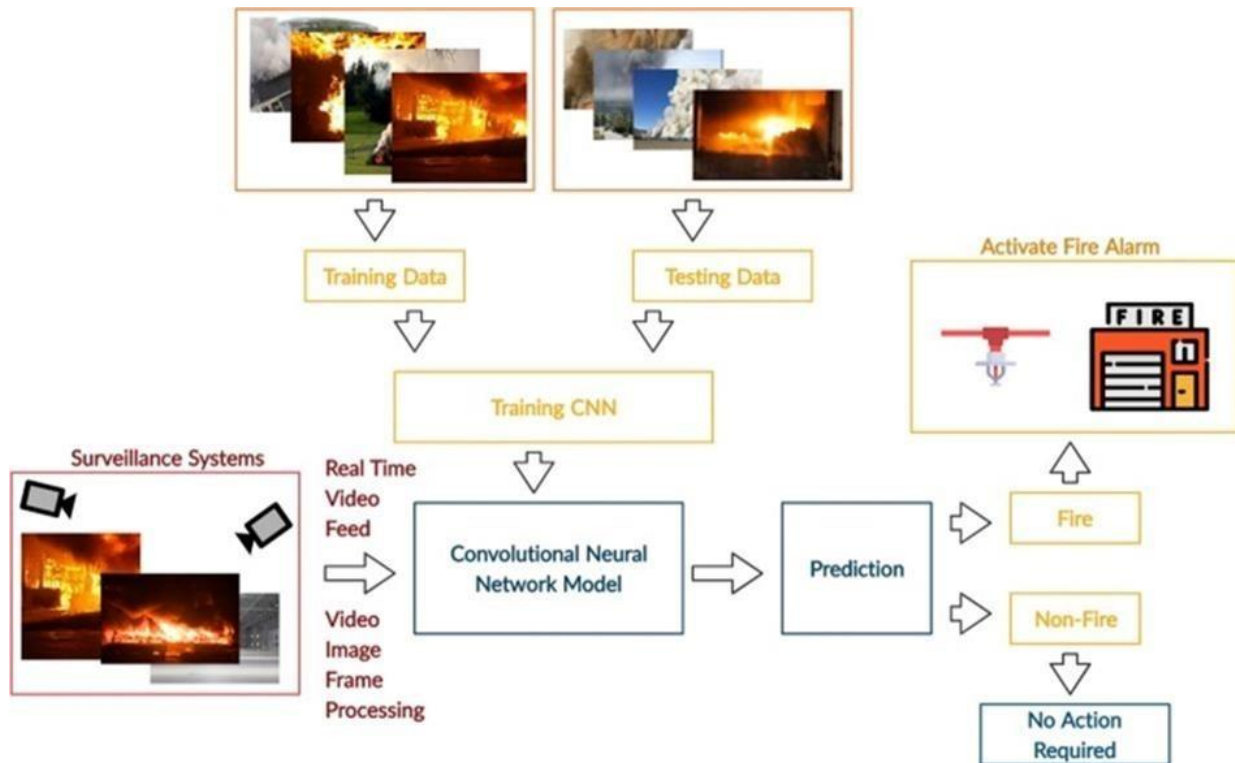

*Not necessary for understanding CNN's, but there's no harm in a quick lesson to improve your skills.*

*Step 3-Pooling: In this part, we'll cover pooling and will get to understand exactly how it generally works. Our nexus here, however, will be a specific type of pooling; max pooling. We'll cover various approaches, though, including mean (or sum) pooling. This part will end with a demonstration made using a visual interactive tool that will definitely sort the whole concept out for you.*

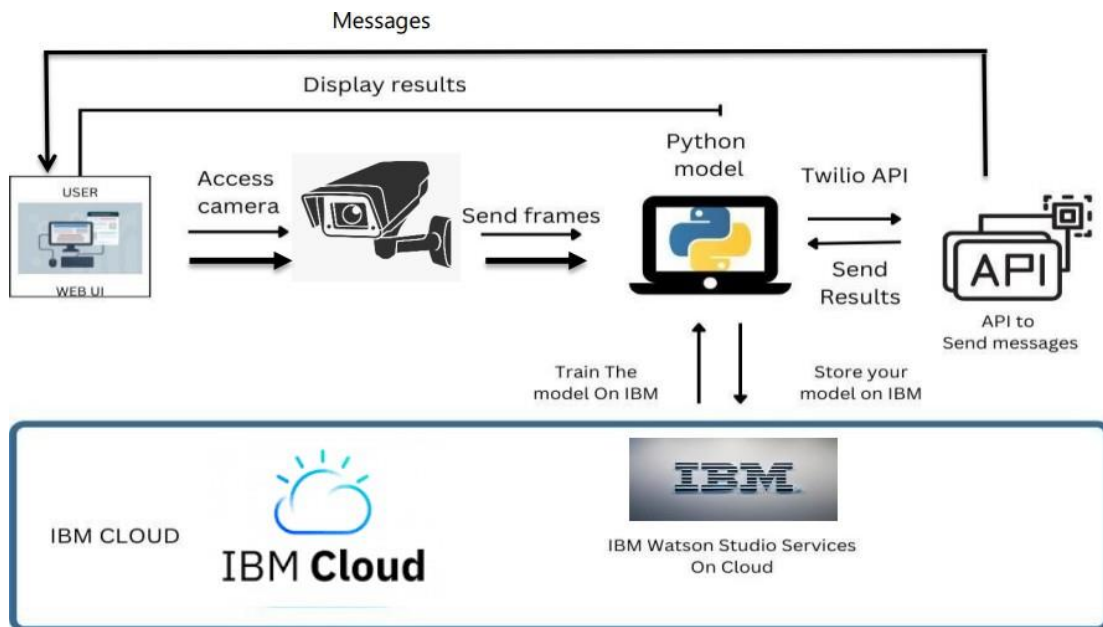

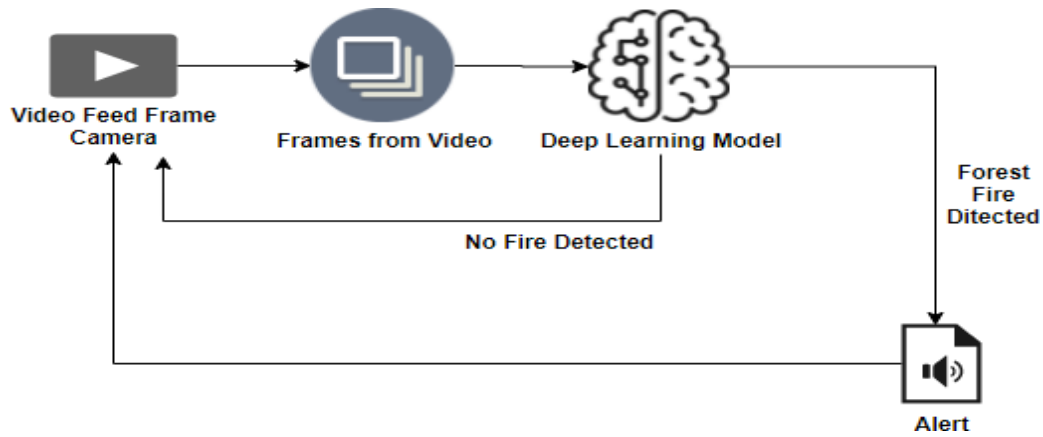

*Step 4 -Flattening: This will be a brief breakdown of the flattening process and how we move from pooled to flattened layers when working with Convolutional Neural Networks.*

*Step 5-FullConnection: In this part, everything that we covered throughout the section will be merged together. By learning this, you'll get to envision a fuller picture of how*

*Convolutional Neural Networks operate and how the "neurons" that are finally produced learn the classification of images.*

## Technology Architecture

**Table 1: Components and Technologies**

| <b>S.No</b> | <b>Component</b>         | <b>Description</b>   | <b>Technology</b>                                 |

## User Stories

### User Stories

Use the below template to list all the user stories for the product.

| User Type        | Functional Requirement (Epic) | User Story Number | User Story / Task   | Acceptance criteria   | Priority | Release  |
|------------------|-------------------------------|-------------------|---|---|----------|----------|
| Environmentalist | Collect the data              | USN-1             | As an Environmentalist, it is necessary to collect the data of the forest which includes temperature, humidity, wind and rain of the forest | It is necessary to collect the right data else the prediction may become wrong              | High     | Sprint-1 |
|                  |                               | USN-2             | Identify algorithms that can be used for prediction   | To collect the algorithm to identify the accuracy level of each algorithms                  | Medium   | Sprint-2 |
|                  |                               | USN-3             | Identify the accuracy of each algorithms  | Accuracy of each algorithm-calculated so that it is easy to obtain the most accurate output | High     | Sprint-2 |
|                  |                               | USN-4             | Evaluate the Dataset  | Data is evaluated before processing   | Medium   | Sprint-1 |
|                  |                               | USN-5             | Identify accuracy, precision, recall of each algorithms   | These values are important for obtaining the right output                                   | High     | Sprint-3 |
|                  |                               | USN-6             | Outputs from each algorithm are obtained  | It is highly used to predict the effect and to take precautionary measures.                 | High     | Sprint-4 |

## 6. PROJECT PLANNING & SCHEDULING

### *Sprint Planning & Estimation*

| Sprint   | Functional Requirement (Epic) | User Story Number | User Story / Task  | Story Points | Priority | Team Members                                     |
|----------|-------------------------------|-------------------|--|--------------|----------|--|
| Sprint-1 | DATA COLLECTION               | USN-1             | Data collected by sensors aboard orbiting satellites, carried aboard aircraft, or installed on the ground provide a wealth of data that can be used to assess conditions before a burn and track the movement of a wildfire in near real-time. | 10           | High     | Pranati<br>Monisha<br>Preethi<br>Sangeetha Priya |
| Sprint-1 | IMAGE PREPROCESSING           | USN-2             | Image processing-Image processing technique automatically detect forest fires around the world by using infrared(IR) images sourced from satellites and CNN used for image recognition and tasks that involve the processing of pixel data.    | 7            | Medium   | Pranati<br>Monisha<br>Preethi<br>Sangeetha Priya |
| Sprint-2 | TRAINING AND TESTING          | USN-3             | The model is trained for detecting the fire by training with real time work and the testing is done according the accuracy of the model  | 10           | high     | Pranati<br>Monisha<br>Preethi<br>Sangeetha Priya |

| Sprint   | Functional Requirement (Epic) | User Story Number | User Story / Task  | Story Points | Priority | Team Members                                     |
|----------|-------------------------------|-------------------|--|--------------|----------|--|
| Sprint-3 | REVIEWING THE MODEL           | USN-4             | The main task is to check that the model is efficient to work in real time to ensure there is no error in the model              | 7            | Medium   | Pranati<br>Monisha<br>Preethi<br>Sangeetha Priya |
| Sprint-4 | IMPLEMENTATION                | USN-5             | After completing every step the model is implemented on the forest and the quick responses is collected from forest organization | 10           | High     | Pranati<br>Monisha<br>Preethi<br>Sangeetha Priya |

## ***Sprint Delivery Schedule***

### **Project Tracker, Velocity & Burndown Chart:**

| <b>Sprint</b> | <b>Total Story Points</b> | <b>Duration</b> | <b>Sprint Start Date</b> | <b>Sprint End Date (Planned)</b> | <b>Story Points Completed (as on Planned End Date)</b> | <b>Sprint Release Date (Actual)</b> |
|---------------|---------------------------|-----------------|--------------------------|----------------------------------|--|-------------------------------------|
| Sprint-1      | 20                        | 6 Days          | 24 Oct 2022              | 29 Oct 2022                      | 8  | 29 Oct 2022                         |
| Sprint-2      | 20                        | 6 Days          | 31 Oct 2022              | 05 Nov 2022                      | 7  | 08 Nov 2022                         |
| Sprint-3      | 20                        | 6 Days          | 07 Nov 2022              | 12 Nov 2022                      | 8  | 15 Nov 2022                         |
| Sprint-4      | 20                        | 6 Days          | 14 Nov 2022              | 19 Nov 2022                      | 7  | 20 Nov 2022                         |

### **Velocity:**

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

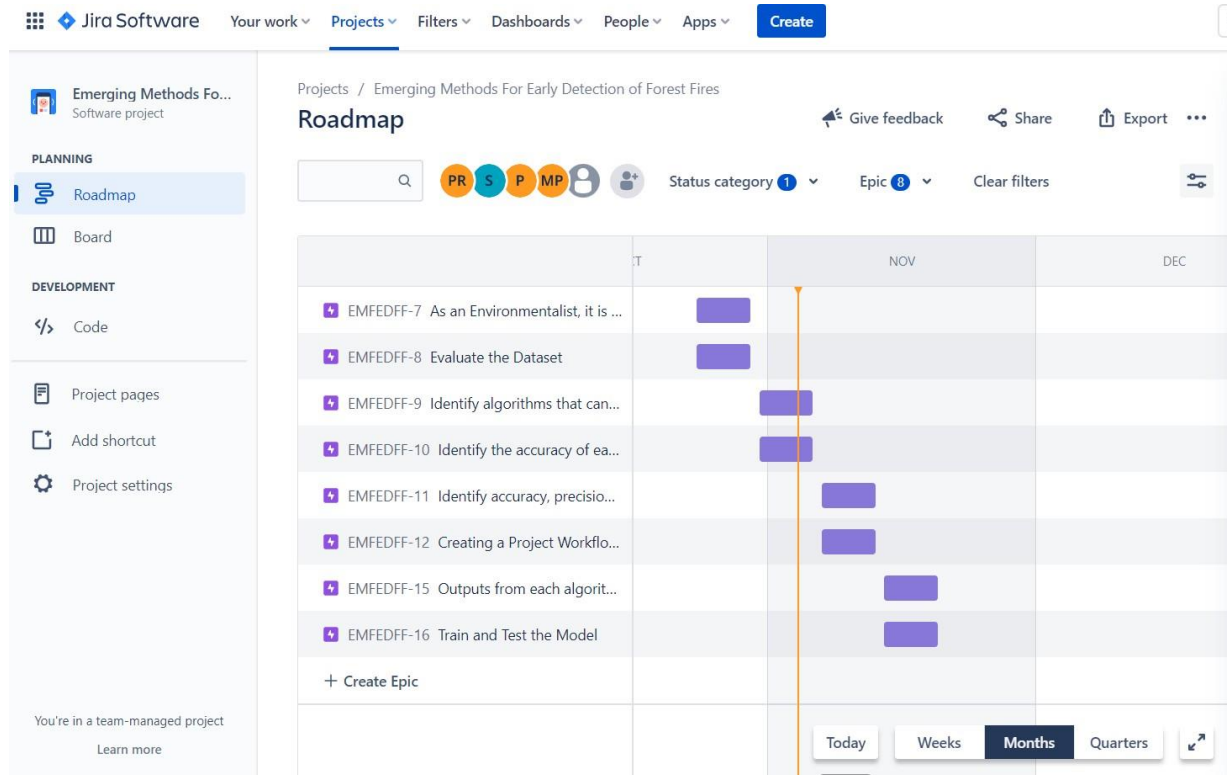

$$AV = \frac{\text{sprint duration}}{\text{velocity}} = \boxed{7/10 = 0.7}$$

### Burndown Chart:

A burn down chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burn down charts can be applied to any project containing measurable progress over time.

# Reports from JIRA

## 7. CODING AND SOLUTION

### Feature 1

- *Language used: Python*
- *Tools/IDE: Google Colab*

```
In [107... from google.colab import drive
drive.mount('/content/drive')
```

Drive already mounted at /content/drive; to attempt to forcibly remount, call drive.mount("/content/drive", force\_remount=True).

Data Collection

```
In [108... !unzip '/content/drive/MyDrive/archive.zip'
```

Archive: /content/drive/MyDrive/archive.zip  
replace Dataset/Dataset/test\_set/forest/0.48007200\_1530881924\_final\_forest.jpg? [y]es, [n]o, [A]ll, [N]one, [r]ename:

Image Pre-processing

```
In [109... from keras.preprocessing.image import ImageDataGenerator
train_datagen = ImageDataGenerator(rescale=1./255,
                                   shear_range=0.2,
                                   rotation_range=180,
                                   zoom_range=0.2,
                                   horizontal_flip=True)
test_datagen = ImageDataGenerator(rescale=1./255)
train = train_datagen.flow_from_directory('/content/Dataset/Dataset/test_set',
                                          target_size=(128,128),
                                          batch_size=32,
                                          class_mode='binary')
test = train_datagen.flow_from_directory('/content/Dataset/Dataset/train_set',
                                         target_size=(128,128),
                                         batch_size=32,
                                         class_mode='binary')
```

Found 121 images belonging to 2 classes.  
Found 436 images belonging to 2 classes.

Sprint 2

```
In [110... #Model Building
from keras.models import Sequential
from keras.layers import Convolution2D, MaxPooling2D, Dense, Flatten
import warnings
warnings.filterwarnings('ignore')
```

In [111]

```
#Initializing the model and adding CNN and Dense layers
model = Sequential()
model.add(Convolution2D(32,(3,3),input_shape=(128,128,3),activation='relu'))
model.add(MaxPooling2D(pool_size=(2,2)))
model.add(Flatten())
model.add(Dense(units=256,activation='relu'))
model.add(Dense(units=1,activation='sigmoid'))
model.summary()
```

# **User Acceptance Testing**

## **1. Purpose of Document**

User Acceptance Testing (UAT) is a type of testing performed by the end user or the client to verify/accept the software system before moving the software application to the production environment. UAT is done in the final phase of testing after functional, integration and system testing are done.

The main Purpose of UAT is to validate end to end business flow. It does not focus on cosmetic errors, spelling mistakes or system testing. User Acceptance Testing is carried out in a separate testing environment with production-like data setup. The arises once software has undergone Unit, Integration and System testing because developers might have built software based on requirements document by their own understanding and further required changes during development may not be effectively communicated to them, so for testing whether the final product is accepted by client/end-user, user acceptance testing is needed.

## **2. Defect Analysis**

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

| Resolution | Severity 1 | Severity 2 | Severity 3 | Severity 4 | Subtotal |
|------------|------------|------------|------------|------------|----------|
| By Design  | 1          | 1          | 2          | 0          | 4        |
| Duplicate  | 0          | 0          | 0          | 0          | 0        |
| External   | 0          | 0          | 2          | 1          | 3        |
| Fixed      | 4          | 2          | 4          | 1          | 11       |

|                |   |   |   |   |    |
|----------------|---|---|---|---|----|
| Not Reproduced | 0 | 0 | 0 | 0 | 0  |
| Skipped        | 0 | 0 | 1 | 1 | 2  |
| Won't Fix      | 0 | 0 | 0 | 1 | 1  |
| Totals         | 5 | 3 | 9 | 4 | 21 |

### 3. Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

| Section             | Total Cases | Not Tested | Fail | Pass |
|---------------------|-------------|------------|------|------|
| Client Application  | 10          | 0          | 0    | 10   |
| Security            | 2           | 0          | 0    | 2    |
| Performance         | 2           | 0          | 0    | 2    |
| Exception Reporting | 2           | 0          | 0    | 2    |
| Final Report Output | 3           | 0          | 0    | 3    |

## 10. ADVANTAGES AND DISADVANTAGES

### ADVANTAGES:

1. *The proposed model can be used in combination with a nightcamera and a thermal camera in a forest to identify tiny fire signs.*
2. *More datasets and images can be used to train for a more accurate outcome when detecting flame destruction ability.*
3. *The model can be implemented in mobile*
4. *applications for camping experience enthusiasts.*

### DISADVANTAGES:

1. *The model works for limited information.*
2. *The accuracy is low because to the limited quantity/quality of photos in the dataset, but this may easily be increased by changing the dataset.*
3. *The small amount of fire amount detection can also cause to trigger the alarm.*

## **APPLICATIONS:**

- 1. It will contribute to surveillance technology that improves the accuracy and predictability of fire detection.*
- 2. able to detect the fire forestmore precisely, as well as some forest plants and wildlife.*
- 3. Detect the amount of dangers that should be treated and those that should not. extra assistance in contacting fire fighters for assistance system.*

## **11.CONCLUSION**

*Forest fires are a major cause of rain forest and savanna degradation. This model will aid in minimizing destruction by anticipating it to the system, allowing individuals to react more quickly and prevent it. The proposed methodology would deconstruct the threat to the environment by converting the image collected into signals that will trigger an alarm. This system transmits video images to a model, which recognizes them and determines whether to send a threat alert or not. The model extracts data from video feeds and defines image*

*processing into RGB data for signal response modelling.*

## **12. FUTURE SCOPE**

*The availability of fire-fighting technology brings us one step closer to new AI for detection and security in the forest and at home. With the addition of a motion sensor, the technology can simply expand to compact decision-making with the addition of new software and hardware. The system is utilized as a drone and surveillance system UAV to expand the surveillance area and detect heat signatures in order to identify human from fire plasma signatures.*
